

~/ai-transformation \$

Keep it simple, stupid.

More relevant than ever in the AI era.

The best AI tool for your team is the one you
can explain in one slide.

01 / The real problem

AI transformation isn't a tech problem

It's an organizational one.

Teams are overloaded with information and new tools. Anything complex gets ignored.

02 / The trap

Complex systems are hard to adopt

Leadership often looks for results in:

- > custom platforms
- > integrations
- > layers of automation

Each layer is one more thing to learn.

The easiest to explain won

I tried to roll out many tools in my team. What stuck was `OpenSpec`, a lightweight open-source framework for spec-driven development.

- > one command to install: `npm install -g @fission-ai/openspec@latest`
- > works in Claude Code, Codex, Cursor and 36 more tools
- > specs are Markdown files in your repo

Five commands. That's it.

explore: map the problem

propose: write the spec

apply: build it

verify: check against the spec

archive: update the specs

↪ back to explore: map the problem

05 / My advice

Easy to start. Deep to master.

- > go deep into every step, don't rush to code
- > customize it for your team, there's almost no limit

**The deeper you know a simple tool,
the better your results.**

**The best AI
process is the one
your team actually
follows.**

**Are you also tired of the endless
stream of hyped AI tools?**
